- Model: SEMIRIGID

Buy Now From £79.00 ex VAT (£92.83 inc VAT)

Delivered in 1-2 working days

Prices are valid for 7 days from Tuesday 07 September, 2010

Product Information

Most people want to feel safe and steady when climbing down a ladder from a top floor window. Most rope and chain style ladders can swing and sway giving an unsettling feeling. Not really what you want in the midst of an emergency. These ladders address this problem by replacing the traditional rope or chain style of manufacture with a series of innovative interlocking sections that are designed to lock semi-rigid so that you won't sway or swing through passing windows as you descend. This makes the ladders extremely safe especially if an adult is helping, or carrying, a young child on the way down. Combined with the stand offs that each steel rung has the business of getting down fast becomes much, much easier. The stand offs stop the ladder getting too close to the wall so that you can get a firm footing on the flat rungs safely as you climb down. Key to the ladders safe use is securing the clamping, or mounting of the ladder hook at the point of exit. Unlike many other fire escape ladders the Semi-Rigid escape ladders clamps onto the wall below the window instead of the sill or window frame. The hook is adjustable and is designed to clamp over a water radiator, for a much more secure descent. The hooks can adjust to accommodate wall thicknesses of up to 20 inches (just over 50cm). The ladders can be set up in seconds in the case of an emergency. They are simply positioned over the wall below the window and release by pulling a cord. The ladders are designed to fall down into place allowing you to make your exit. When rolled up the ladders are compact and light so it is straightforward to store them in a wardrobe or under a bed. On average the ladders are approx 30cm x 50cm when folded for storage. The semi-rigid fire escape ladders are manufactured in the UK to a superior standard using zinc-plated mild steel tubing and have been independently tested to withstand a distributed load of 454 kg (71 st).

Product Sizes & Details

| Escape From | Length | Weight | Stock Code | Price |
|------------------------------------|---------------|---------|------------|----------------------------------|

Need Help Finding Just the Right Ladder or Access Solution?

At Ladderstore we have a wealth of knowledge and expertise in the ladder and access equipment industry. Whatever your requirements we have probably supplied a very similar solution, or our engineers have designed and fabricated a tailor made solution.

All you need to do is contact us with as much information and detail as possible. If you have technical drawings, or have made your own rough sketches, then send them to us by fax on 01204 595 421 and then call or email us to discuss your requirements.

If you can't find the ladders or access equipment that you need then get in touch, by email to mail@ladderstore.com, or by using the 'Ladder Finder' Tool on our website - www.ladderstore.com.

Case Study : Making Safety a Priority

Read about how City Response used LadderLog products to achieve Working at Height best practices. You can read the case study on our LadderNews website at www.laddernews.com.

"We found Ladderlog on the web and recognised that its format and style would suit the stores around the cityresponse plants. The staff working in the stores needed a user friendly system, but above all, one where results and records could be printed off as hard copy – a simple at-a-glance check, vital when you are dealing with as many as 60 to 80 ladders at any one time."

If you are a business or organisation and you are not using a system like LadderLog then you are not attaining Working at Height best practice, and that can have serious repercussions for you and your company. For more details visit www.ladderlog.com, today!
